# The Parametrized Extrapolator #2

Student: Krištof Špenko

Mentors: Andrii Usachov and Miriam Lucio Martinez, with prof. Pierre Billoir and the TrackFit Group

LHCb Tuesday Meeting, 7.9.2021

Magnetic Field map visualizer: <u>gitlab</u> Extrapolator sandbox: <u>gitlab</u>

### About me

- Live in Kamnik, Slovenia.
- Studying for my Master's Degree in Mathematical Physics at the University in Ljubljana.
- Love to paint and play music.
- Previous work on RK and NN: github

# Jožef Stefan Institute

### Run 3:

- Higher luminosity 
   → more events 
   → more
   tracks 
   → Longer CPU Time!!
- TrackFit more than 20% of HLT2 CPU time!
- Baseline RK extrapolator more than 35% of TrackFit CPU time!! BOTTLENECK source:

## Track reconstruction:

- Propagating particles along tracks.
- Track is composed of state vectors.
- State vector is described by 5 components.
- Extrapolator perform state vector transitions between two consecutive z-values.

 $Z_i \to Z_f : \vec{x}(Z_i) \to \vec{x}(Z_f)$ 

## **Adaptive Runge-Kutta**

- Adaptive step with different schemes (default: "cash-karp").
- Inability to process multiple tracks in parallel.
- Regions of interest VeLo-UT and UT-T, non-uniform field!

#### Python LHCb adaptive RK: gitlab

## **Magnetic Field Map**

- Studying **B**, and  $\nabla \times \mathbf{B}$ ,  $\nabla \cdot \mathbf{B}$ .
- Visualizing "smooth" map (by prof. Pierre Billoir).

---- a. = 15\*. 0 262 rd a. = 12\*. 0 209 r

 $a_c = 15^\circ$ , 0.262 rd,  $a_s = 12^\circ$ , 0.209 r  $a_c = 14^\circ$ , 0.244 rd,  $a_s = 11^\circ$ , 0.192 r  $a_c = 13^\circ$ , 0.227 rd,  $a_s = 10^\circ$ , 0.175 r  $a_c = 13^\circ$ , 0.024 rd,  $a_c = 10^\circ$ , 0.175 r

a. = 14" 0 244 rd a. = 11" 0 192

a, = 13°. 0.227 rd. a, = 10°. 0.175 a, = 1°. 0.024 rd. a, = 1°. 0.019 rd

- *Smooth* regions are promising for parametrizations.
- Defining central zone |t<sub>y</sub>|<0.2, |t<sub>x</sub>|<0.25.</li>
   (coincides with the majority of tracks ~ 96%)

#### Field Map Visualizer: gitlab

 $\nabla \cdot \vec{B}$ , x=0.0 (mm)

### THE IDEA: Parametrized Mapping (by prof. Pierre Billoir)

- Extrapolating long tracks coming from origin.
- Fit a grid of coefficients for a "semi-empirical" mapping of state vectors between detectors,
  - Fixed  $Z_i \rightarrow Z_f$  extrapolation.
  - Parametrized *A*, *B*, *C* in terms of  $(x_i, y_i)$  each coefficient fitted on 5x30 tracks. (RK Field Map = 28.8MB, 50 thousand coefficients = 2.5MB)
  - Explicit dependence in 9th order polynomial in terms of q/p (fitted on range 2.5-100 GeV).
  - Estimate of initial bending factor.
- Similar concept used for Parametrized Kalman Filter. Now trying to use it in Full Kalman Filter.

$$\mathbf{f}(\mathbf{x}_{i}) = \sum_{k=1}^{K_{1}} \mathbf{A}_{k}(x_{i}, y_{i}) \left(\frac{q}{p}\right)^{k} + \sum_{k=1}^{K_{2}} \left(\mathbf{B}_{k}(x_{i}, y_{i}) \,\delta u + \mathbf{C}_{k}(x_{i}, y_{i}) \,\delta v\right) \left(\frac{q}{p}\right)^{k}$$
  

$$\overset{\text{ideal}}{\underset{\text{real}}{\overset{\text{ideal}}}{\overset{\text{ideal}}}{\overset{\text{ideal}}{\overset{\text{ideal}}{\overset{\text{ideal}}{\overset{\text{ideal}}{\overset{\text{ideal}}{\overset{\text{ideal}}{\overset{\text{ideal}}{\overset{\text{ideal}}{\overset{\text{ideal}}{\overset{\text{ideal}}}{\overset{\text{ideal}}{\overset{\text{ideal}}}{\overset{\text{ideal}}}{\overset{\text{ideal}}}{\overset{\text{ideal}}}{\overset{\text{ideal}}}{\overset{\text{ideal}}{\overset{\text{ideal}}}{\overset{\text{ideal}}}{\overset{\text{ideal}}}{\overset{\overset{\text{ideal}}}{\overset{\text{ideal}}}}{\overset{\overset{\text{ideal}}}{\overset{\text{ideal}}}{\overset{\text{ideal}}}{\overset{\overset{\text{ideal}}}{\overset{\overset{\text{ideal}}}}{\overset{\overset{\text{ideal}}}{\overset{\overset{\text{ideal}}}{\overset{\overset{\text{ideal}}}}{\overset{\overset{\text{ideal}$$

### Testing the performance

- Not every track dataset is representative!
- Bouquet tracks dataset (z=0: uniform  $t_x$ ,  $t_y$ , q/p, Gaussian spread in x, y extrapolated to  $z=Z_1$ )

• Measure of sufficient accuracy  $\rightarrow 0.1 \times \text{external error estimate}$ (multiple scattering + measurement error). code: gittab  $\sigma_{\text{external}}^2 = \sigma_{\text{m.s.}}^2 + \sigma_{\text{meas}}^2$ 

# Implementation on the Stack software 🔽

### - UT-T extrapolations

# Implementation on the Stack software VeLo-UT extrapolations

## **TODO = Different Modes**

- Testing different "modes" of propagation:
  - Two step propagation  $Z_1 \rightarrow 0 + 0 \rightarrow Z_2$  (avoid initial bending factor).
- 1. VeLo UT

2. UT - T

#### • BACKWARD propagation:

- a. Backward propagation,
- b. Two step propagation to origin,
- c. using "Newton-Raphson" algorithm (one iteration is sufficient):

### **TODO = Can NN do better?**

- Incorporating a NN in the future:
  - Brute-force Machine learning probably not (slower). 🗙
  - Capable of adding higher order corrections!
  - Best of both worlds? Physics based NN architecture!? (replace fitting coefficients with "training") ?

<u>source</u>

### **CONCLUSION:**

- Magnetic Field Visualizer for studying different field maps. gittab
- Extrapolator (Python) sandbox for studying and analysing extrapolators. gitlab
- LHCb implementation of parametrized extrapolator works well!
- Code needs to be vectorized/parallelization potential GPU.
- Jacobian elements future testing.
- Neural network, new field brings interesting but complicated ideas!

## **BOUQUET** Tracks for $Z_1 \rightarrow Z_2$ :

- 1. Generate random momentum:
  - a.  $q/p \in (-1/2.5 \text{GeV}, -1/100 \text{ GeV}) \cup (1/100 \text{ GeV}, 1/2.5 \text{GeV})$  UNIFORM,
- 2. At *z*=0 generate random state vectors:
  - a. x GAUSSIAN spread around 0 with  $\sigma$  = 0.03mm,
  - b. *y* **GAUSSIAN** spread around 0 with  $\sigma$  = 0.03mm,
  - c.  $t_x \in (-0.25, 0.25)$  radians UNIFORM,
  - d.  $t_v \in (-0.20, 0.20)$  radians UNIFORM,
- 3. z=0 state is propagated to  $Z_1$  with reference extrapolator.
- 4. Check if state is in central region at  $Z_1$ :
  - a.  $|x| \le Z_1 \times 0.25$ ,
  - b.  $|y| \le Z_1 \times 0.20$ ,
  - c.  $|t_{x}| \le 0.25$ ,
  - d.  $|t_{v}| \le 0.20$ ,
- If state vector is in central region at Z<sub>1</sub> ACCEPT as initial state vector in dataset. Otherwise go back to STEP 2!

### ACCURACY CRITERION: $z_1 = 2500 \text{mm} \rightarrow Z_2 = 7500 \text{mm}$

the extrapolation error should be « small » compared to the *external* error (contribution of multiple scattering along extrapolation and measurement errors in the downstream part)

conservative estimation of external error

• multiple scattering in air (~ 5 m): 0.017  $X_{rad}$ 

 $\sigma(t_x) = \sigma(t_y) \approx 1.8 \ 10^{-3} / p(GeV)$   $\sigma(x) = \sigma(y) \approx 5 \ mm / p(GeV/c)$ 

• measurement error (neglecting mult. scatt. in T1,T2,T3)  $\sigma(x) \approx 0.03 \text{ mm } \sigma(y) \approx 0.3 \text{ mm } \sigma(t_x) \approx 0.025 \text{ 10}^{-3} \sigma(t_y) \approx 0.25 \text{ 10}^{-3}$ then:  $\sigma_{\text{external}}^2 = \sigma_{\text{m.s.}}^2 + \sigma_{\text{meas}}^2$ 

error dominated by multiple scattering (except for very high momentum)

if extrapolation and external errors are independent:

 $\sigma_{\text{extrap}} = 0.1 \sigma_{\text{external}} \rightarrow +0.5 \%$  on combination : acceptable ?

### **JACOBIAN Elements**

$$\boldsymbol{x}_{k|k-1} = \boldsymbol{f}_{k}(\boldsymbol{x}_{k-1|k-1}),$$

$$\boldsymbol{P}_{k|k-1} = \boldsymbol{F}_{k}\boldsymbol{P}_{k-1|k-1}\boldsymbol{F}_{k}^{T} + \boldsymbol{Q}_{k},$$

$$\begin{pmatrix} \frac{\partial f_{x}}{\partial x} & \frac{\partial f_{x}}{\partial y} & \frac{\partial f_{x}}{\partial t_{x}} & \frac{\partial f_{x}}{\partial t_{y}} & \frac{\partial f_{x}}{\partial \frac{q}{p}} \\ \frac{\partial f_{y}}{\partial x} & \frac{\partial f_{y}}{\partial y} & \frac{\partial f_{y}}{\partial t_{x}} & \frac{\partial f_{y}}{\partial t_{y}} & \frac{\partial f_{y}}{\partial \frac{q}{p}} \\ \frac{\partial f_{t_{x}}}{\partial x} & \frac{\partial f_{t_{x}}}{\partial y} & \frac{\partial f_{t_{x}}}{\partial t_{x}} & \frac{\partial f_{t_{x}}}{\partial t_{y}} & \frac{\partial f_{t_{x}}}{\partial \frac{q}{p}} \\ \frac{\partial f_{t_{y}}}{\partial x} & \frac{\partial f_{t_{y}}}{\partial y} & \frac{\partial f_{t_{y}}}{\partial t_{x}} & \frac{\partial f_{t_{y}}}{\partial t_{y}} & \frac{\partial f_{t_{y}}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}{\partial x} & \frac{\partial f_{q/p}}{\partial y} & \frac{\partial f_{q/p}}{\partial t_{x}} & \frac{\partial f_{q/p}}{\partial t_{y}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial t_{x}} & \frac{\partial f_{q/p}}{\partial t_{y}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} & \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} \\ \frac{\partial f_{q/p}}}{\partial \frac{q}{p}} \\ \frac{\partial f$$
