

Search for $B^+ \rightarrow \mu^+ \nu_\mu$

Vitalii Lisovskyi

Supervisor: Xabier Cid Vidal

August 4, 2015

Who am I?

About me

- Master student at Kharkiv National University
- Probably the youngest summer student (19 years old)

Introduction and motivation

analysis

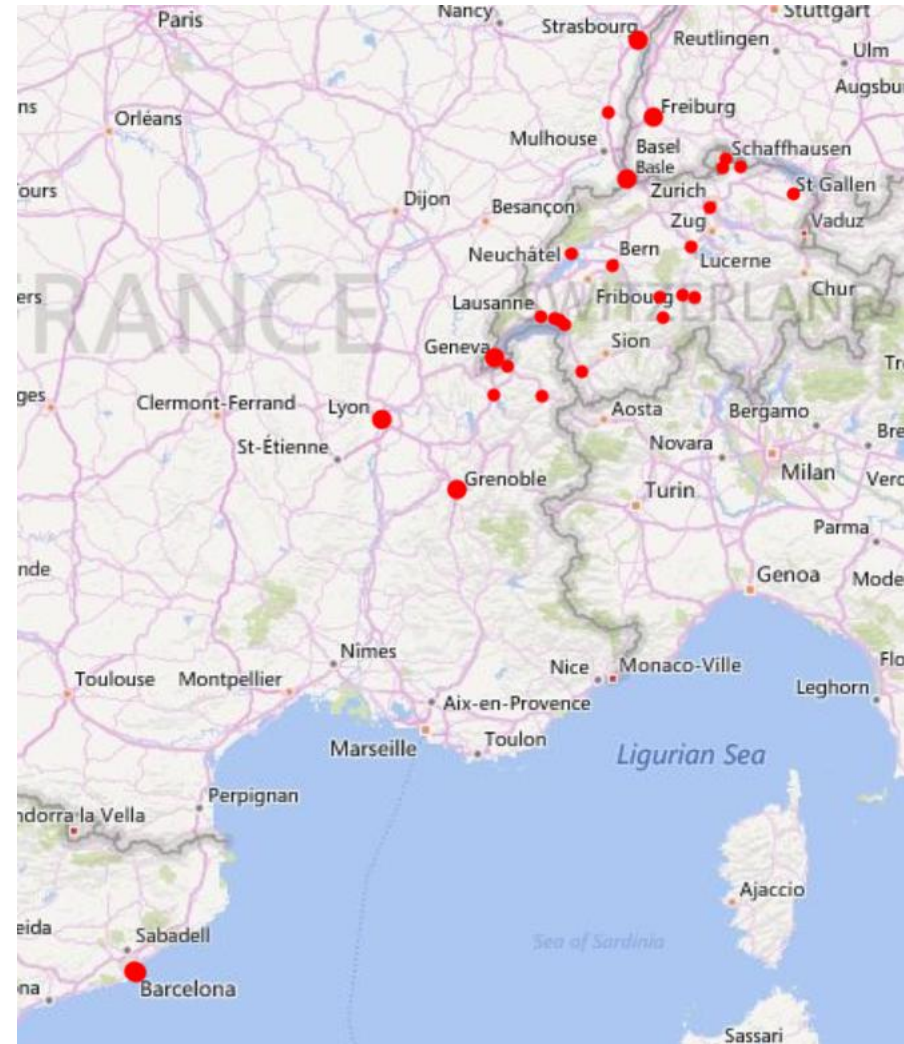

Multivariable
analysis and
BDT

Fit on the
data

Future
perspectives

My second
project

- $B^+ \rightarrow \mu^+ \nu_\mu$ decay
- Suppressed by helicity conservation

- **SM:** $\text{BR}(B^+ \rightarrow \mu^+ \nu_\mu) \approx 4 \cdot 10^{-7}$
- **New Physics:** possible existence of new charged mediators can increase BR

e.g.:

Analysis introduction

Multivariable
analysis and
BDT

Fit on the
data

Future
perspectives

My second
project

- My previous talk on VRD meeting:
https://indico.cern.ch/event/371291/contribution/2/attachments/1129926/1614663/Vitalii_BMuNu_VRD.pdf

- Current best upper limit: around 2xSM

$$B_r < 1 \times 10^{-6} \text{ (90\% CL) (BaBar)}$$

- **Can LHCb break this limit?**

- We may have a chance

- **Challenging analysis:**

- Only **neutrino and muon** in the final state, so the usual **invariant mass** reconstruction is **not possible**

- We must find another variable to fit: **BDT fit**

Analysis introduction

About me

**Introduction
and
motivation**

Variables
used for
analysis

Multivariable
analysis and
BDT

Fit on the
data

Future
perspectives

My second
project

- Types of background: $b\bar{b}$ and $c\bar{c}$ production, with further semileptonic decays with muon in the final state
- Expected **number of signal events** is **smaller** than background, so **background must dominate** in the data
- So, our first purpose is **to ensure that these two types of background describe the data well**

Analysis introduction

About me

**Introduction
and
motivation**

Variables
used for
analysis

Multivariable
analysis and
BDT

Fit on the
data

Future
perspectives

My second
project

- **Data:** 2012 LHCb data, around 78.6 pb^{-1}
- Stripping cuts:
 - muon $p_t > 5 \text{ GeV}/c$ and $\text{IP}\chi^2 > 400$
 - select events with low multiplicity (< 150 tracks)
- **MC:** stripping filtered production
 - signal: 54818 events
 - $b\bar{b}$: 43563 events
 - $c\bar{c}$: 6410 events
- We use variables of different types:
 - Global physics variables
 - Cylinder and cone variables
 - Jet variables

Variables distributions

About me

Plots: **data** vs sum of **MC bb** and **MC cc**.

MC distributions are **reweighted** to match the multiplicity in data and **multiplied by expected number** of each background type

Background modes describe the
data well.
Let's search for signal!

Multivariate analysis

About me

Introduction
and
motivation

Variables
used for
analysis

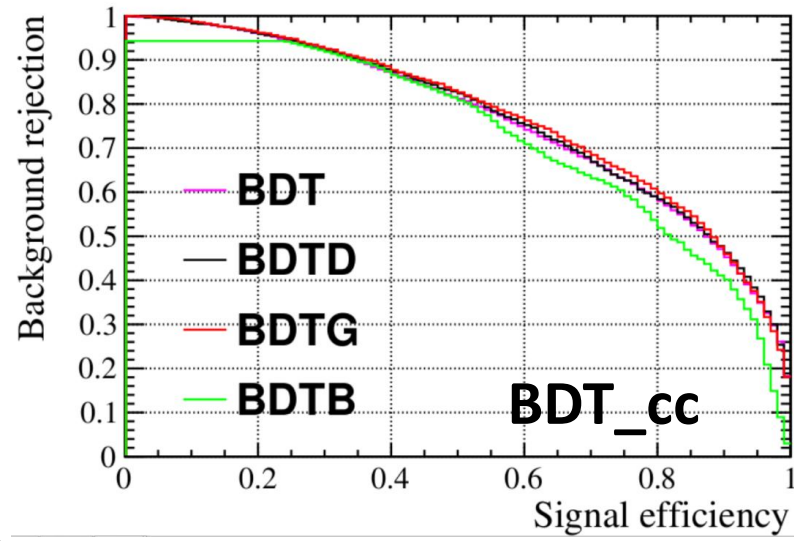

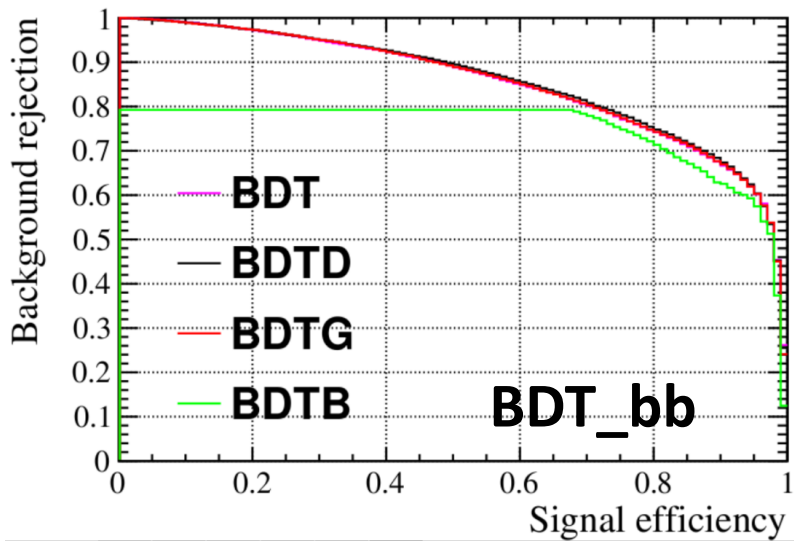

Multivariable
analysis and
BDT

Fit on the
data

Future
perspectives

My second
project

- **Two BDT variables: BDT_bb and BDT_cc**
- For training these BDTs we use:
 - **Same** signal sample (signal MC)
 - **Same** discriminating **variables** (*list was optimized*)
 - **Different** background samples: $b\bar{b}$ MC for BDT_bb and $c\bar{c}$ MC for BDT_cc
- BDTG method chosen as one giving the best separation

BDT distributions

About me

Introduction
and
motivation

Variables
used for
analysis

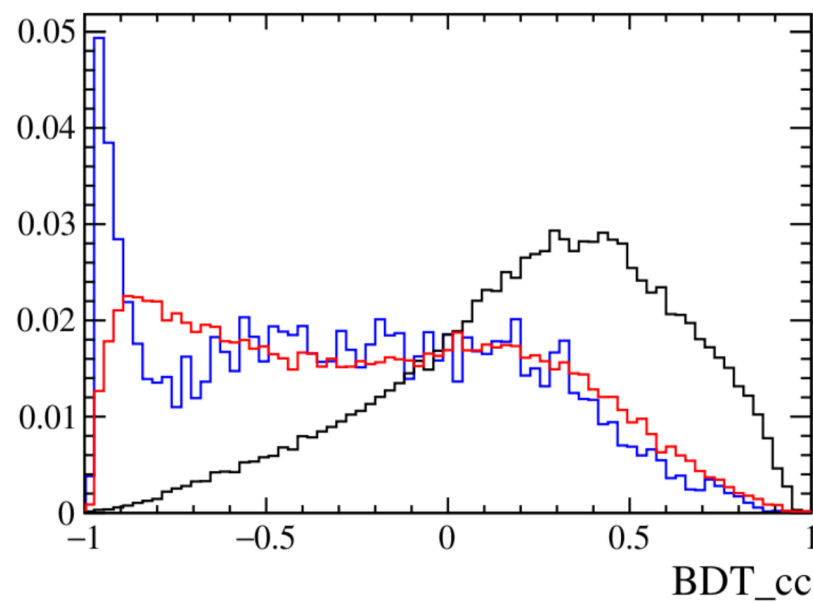

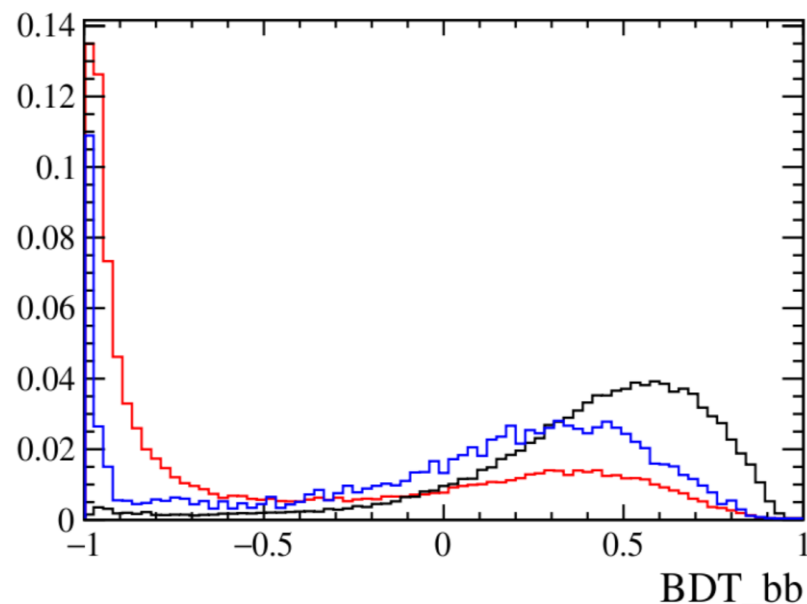

Multivariable
analysis and
BDT

Fit on the
data

Future
perspectives

My second
project

- BDT variables distributions for signal and background modes
- **Black:** MC signal
- **Red:** MC $b\bar{b}$
- **Blue:** MC $c\bar{c}$

and
motivation

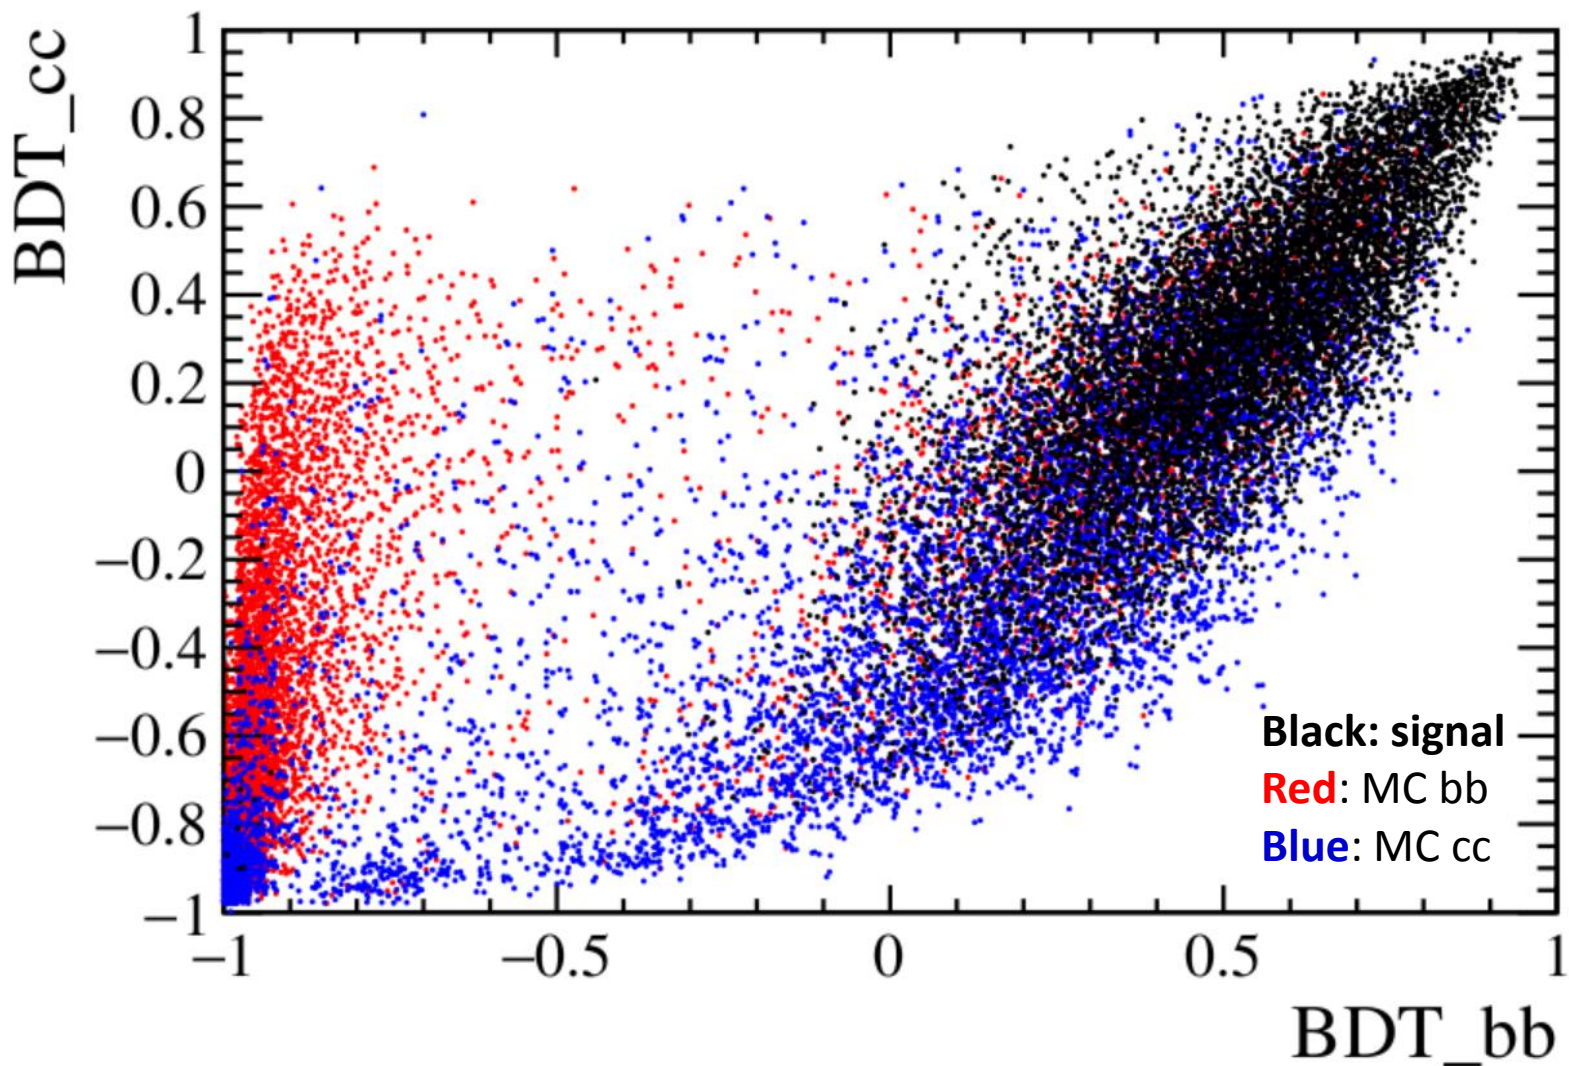

Variables
used for
analysis

Multivariable
analysis and
BDT

**Fit on the
data**

Future
perspectives

My second
project

BDT_bb fit:

$$n_{bb} = 7.98575e+05 \pm 1.57606e+03$$

$$n_{cc} = 1.99501e+05 \pm 1.81548e+03$$

$$n_s = 2.58996e+04 \pm 9.04427e+02$$

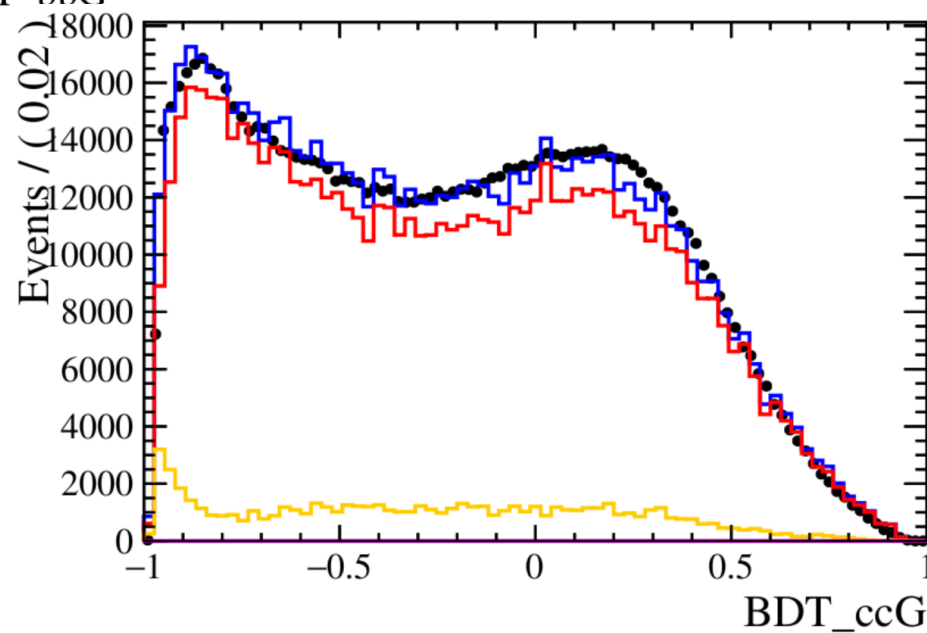

BDT_cc fit:

$$n_{bb} = 9.37571e+05 \pm 3.03045e+03$$

$$n_{cc} = 8.64169e+04 \pm 2.60308e+03$$

$$n_s = 2.37610e-04 \pm 1.55329e+01$$

- Fit is unstable
- BDT_cc has many fluctuations due to low statistics of MC $c\bar{c}$
- 2D fit does not converge

Future perspectives of analysis

About me

and
motivation

Variables
used for
analysis

Multivariable
analysis and
BDT

Fit on the
data

**Future
perspectives**

My second
project

- **$b\bar{b}$ and $c\bar{c}$ backgrounds are dominant**
- Describe the data well → reasonable fit
- **Uncertainties** of fits are much larger than expected number of events so **we can't push a BR limit down right now**, but...
 - MC samples with large number of events
 - BDT training including more variables
 - 2D BDT fit with nonuniform binning
 - Higher statistics during Run II
 - ...

That's not all...

About me

Variables
used for
analysis

Multivariable
analysis and
BDT

Fit on the
data

Future
perspectives

**My second
project**

- I also help with $K_s \rightarrow \mu\mu$ analysis
 - co-supervised by **Jessica Prisciandaro**
- *A longer talk on it I will present on VRD meeting tomorrow...*
- Goal of the analysis: **search** for this decay
- My contribution:
 - Calculating reconstruction and stripping efficiencies
 - Fit of dominant misID background mode

Stripping efficiency

About me

$400 < m(K_s^0) < 600$ or $m(K_s^0) > 465$	99.18	0.01	99.86	0.01	99.99	0.00	99.99	0.01
all stripping cuts	-	-	-	-	19.61	0.06	18.99	0.08

Fit of misID background mode

About me

Introduction
and
motivation

Variables
used for
analysis

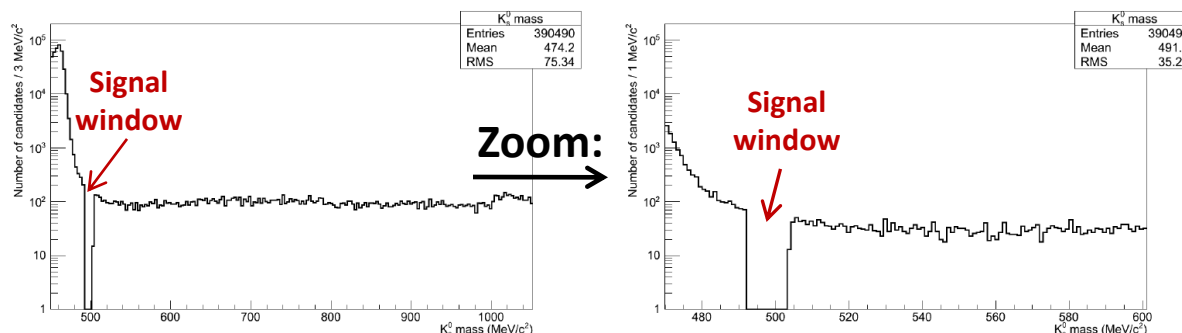

Multivariable
analysis and
BDT

Fit on the
data

Future
perspectives

My second
project

- Some pions can be **misidentified** as muons → huge **misID background** with shifted mass peak (but *still covering the signal window*)

(a) Full mass range

(b) Region around signal

- Necessary to obtain a **best fit** of this background **in the signal window**
 - I used $K_s \rightarrow \pi\pi$ MC with 0/1/both pions misIDd as muons
 - Tried **different shapes** to describe it
 - Compared** the real number of events *in the signal window* with the integral under the fit

Fit of misID background mode

About me

Introduction
and
motivation

Variables
used for
analysis

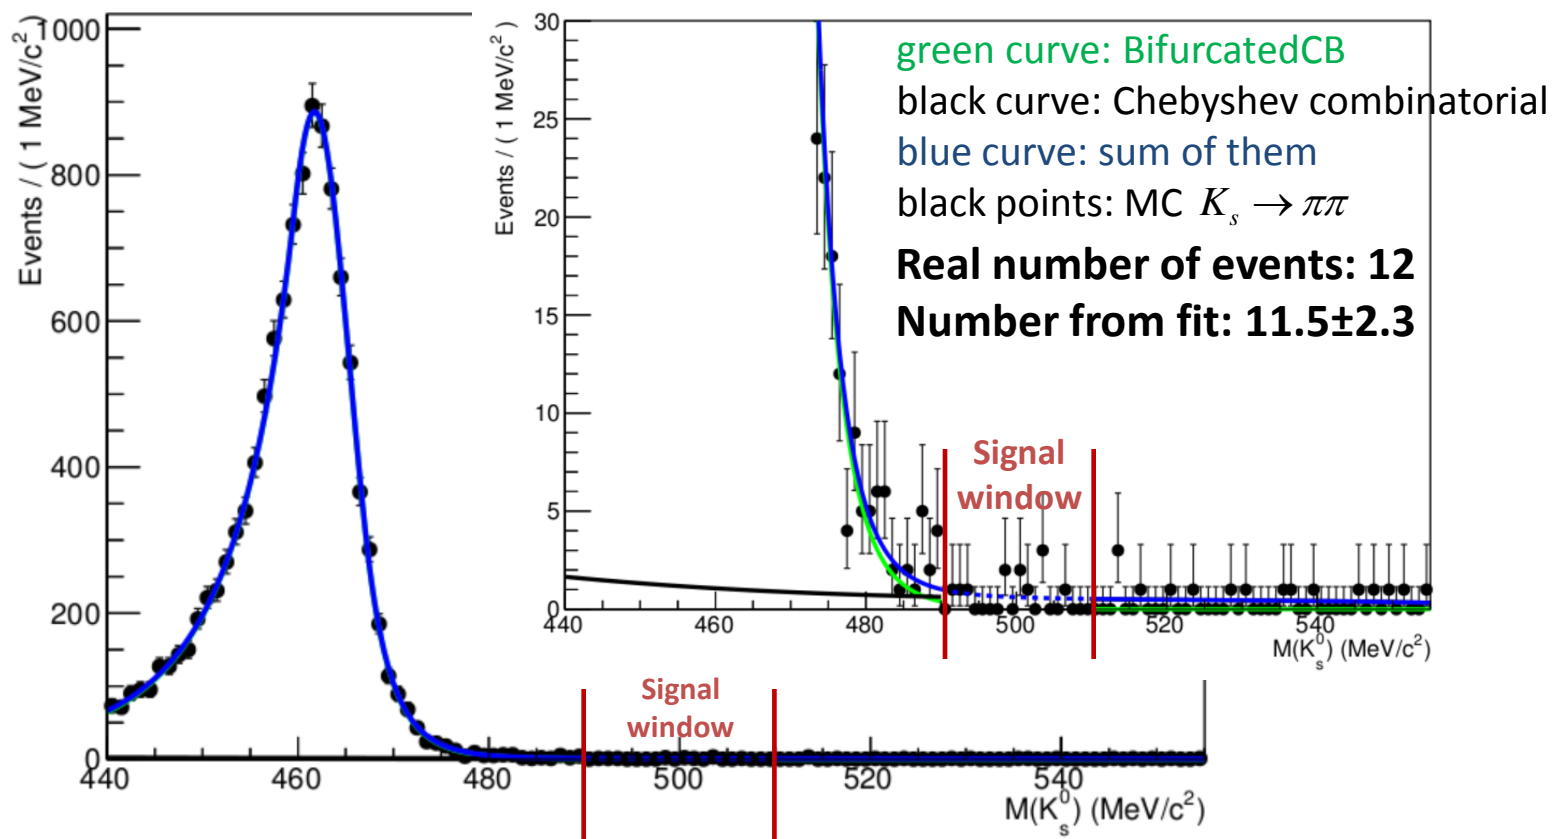

Multivariable
analysis and
BDT

Fit on the
data

Future
perspectives

My second
project

- The **best shape**: **Bifurcated Crystal Ball + Chebyshev 3rd order**
 - I checked the applicability of this fit to 2011 minbias data
 - Looked on fit behavior after different cuts, e.g. on BDT
- My fit model describes the background shape well**

Conclusions

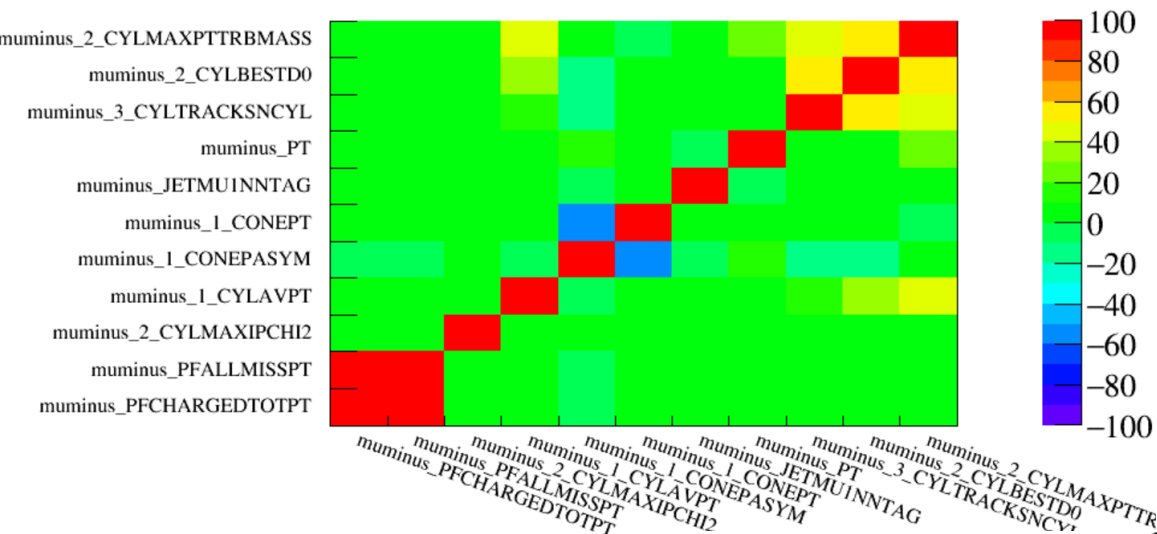

- That's still not all, but my time is over...
- $B^+ \rightarrow \mu^+ \nu_\mu$ analysis:
 - Dominant background modes understood
 - BDT trained and fitted
 - To continue analysis we need much machine and man power
- $K_s \rightarrow \mu\mu$ analysis:
 - Stripping cuts efficiencies calculated, the least efficient cuts identified
 - The best fit of the dominant background channel developed
- Much new knowledge and experience obtained

Thank you for your attention!

Isolation Definition (II)

- We want to select **isolated** muons \rightarrow consider a cylinder around our muon track.
 - Focus on low multiplicity events \rightarrow set maximum number of tracks < 150 .
 - **Isolation** conditions: (considering only Long and VELO tracks)
- ◇ **Tracks in the event outside the cylinder** \rightarrow every track has a DOCA with the signal muon greater than the $DOCA_{cut}$ established.
 - ◇ Tracks **inside** the cylinder are allowed if:
 - They are pointing to the PV (track IP smaller than IP_{cut}).
 - The invariant mass of the system track+muon is larger than the B^+ mass (idea: track+muon+missing ν system is not a 3-body decay from a B meson).
