

Search for the rare decays $B^0_s \rightarrow \mu^+ \mu^-$ and $B^0 \rightarrow \mu^+ \mu^-$

Additional plots for presentations

The Bs2mumu group of LHCb

arXiv:1103.2465

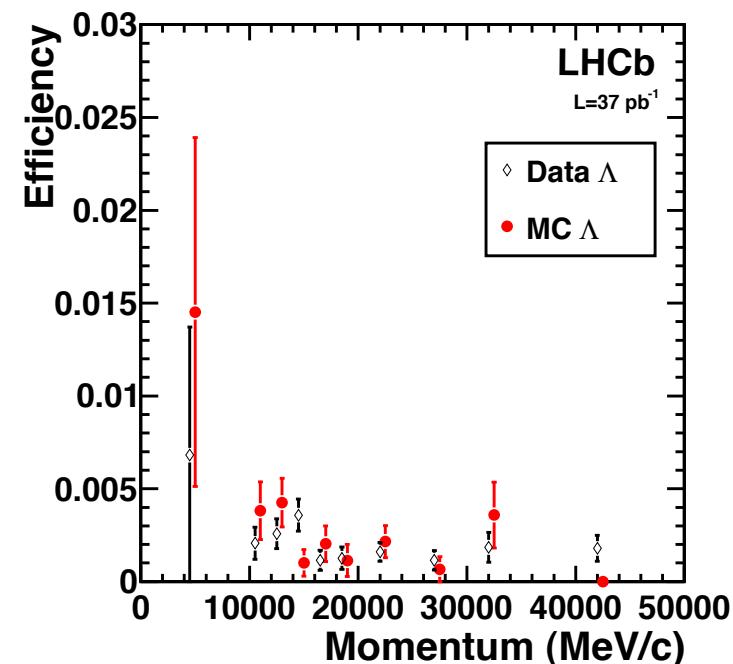

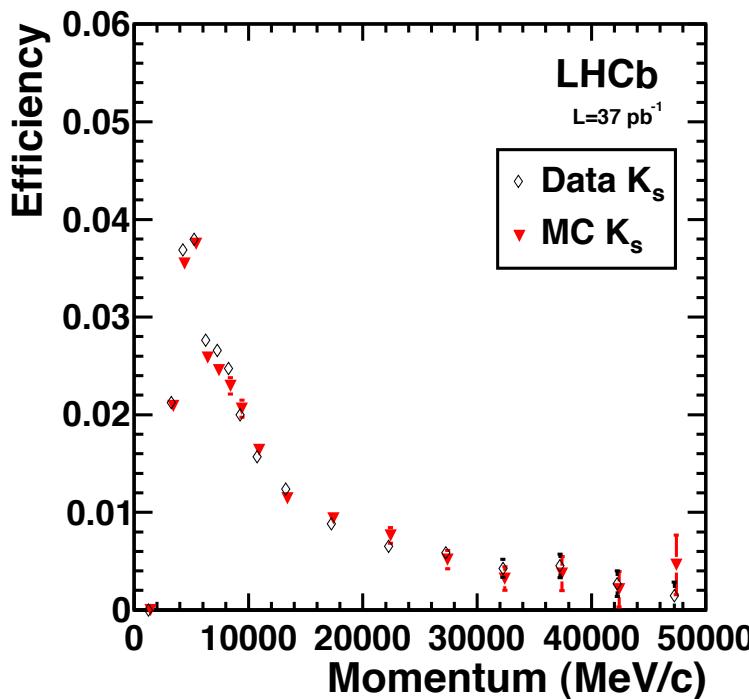

Muon Id efficiency

Muon ID efficiency evaluated with the tag-and-probe method as a function of the momentum of the probe muon, comparison of data (open black) and MC (closed red).

Fig1_MuID_efficiency.pdf / png

MuonID: fake rate Vs momentum

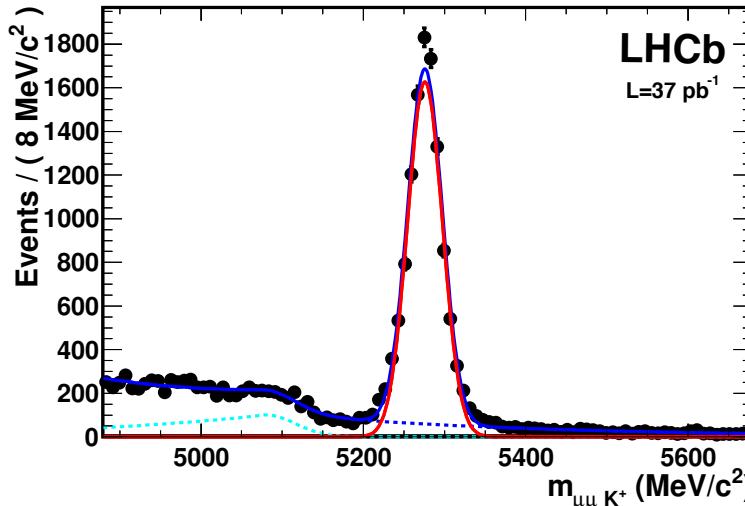

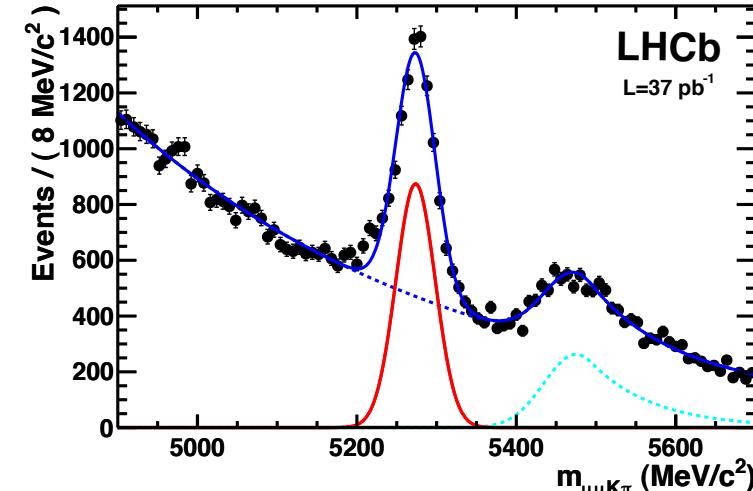

Fake rate probability vs momentum. Left: $\epsilon(\pi \rightarrow \mu)$ from $K_s \rightarrow \pi\pi$, right: $\epsilon(p \rightarrow \mu)$ from $\Lambda \rightarrow p\pi$. Open markers: data, filled markers: MC

Fig2_MuID_misIDPions.pdf / png

Fig3_MuID_misIDProtos.pdf / png

Xcheck: Acceptance from data

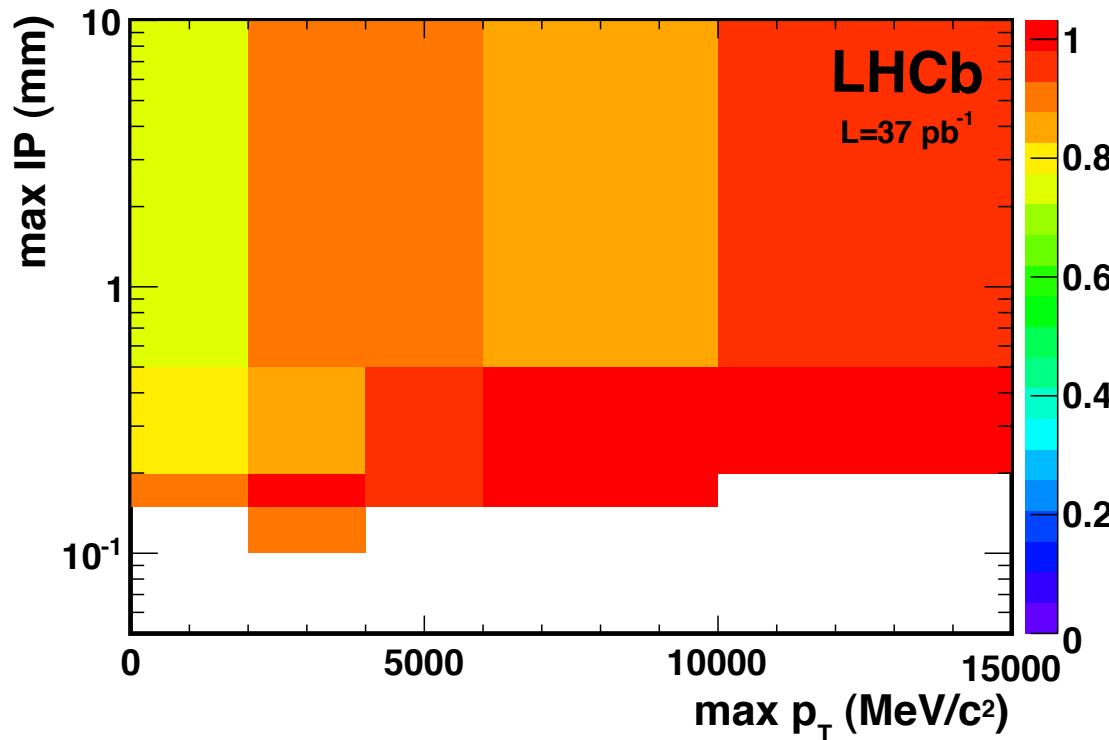

(a) $B^+ \rightarrow J/\psi K^+$ Yield: 10939 ± 113 (b) $B_d^0 \rightarrow J/\psi K^{*0}$ Yield: 6176 ± 76

Mass peaks using a tighter selection (VDS>25 instead of 15, else selection as described in the paper) for the determination of the ratio of acceptance and reconstruction efficiencies.

Fig4_RecoEff_Bu2JPsiK.png / png

Fig5_RecoEff_Bd2JPsiKst.png / png

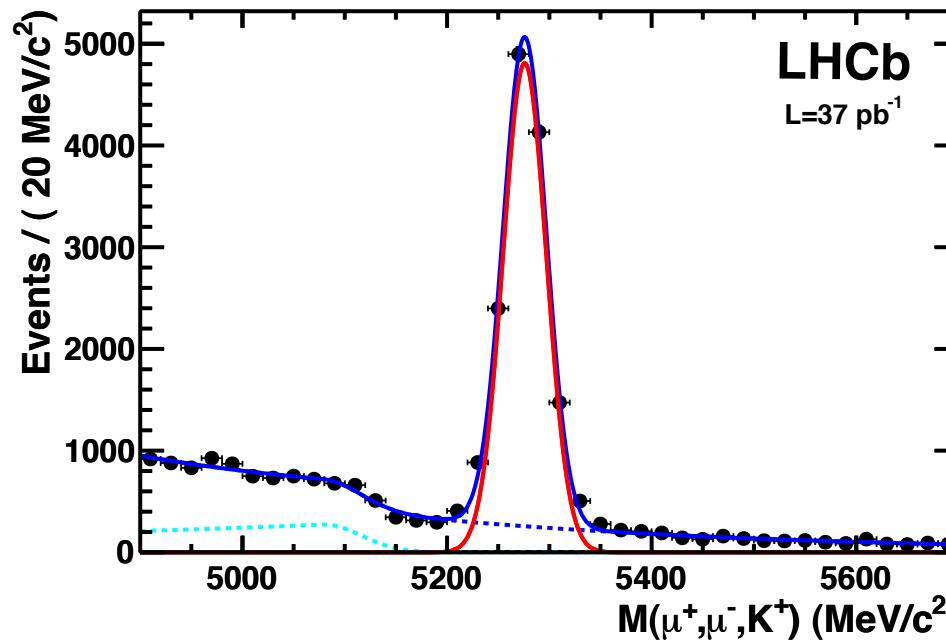

Trigger efficiency map

Trigger efficiency map determined from an inclusive J/ ψ sample
as a function of the maximal PT and IP of the two final state
muons.

Fig6_TrgEff_JPsiMap.pdf / png

Normalization factor 1: JPsik

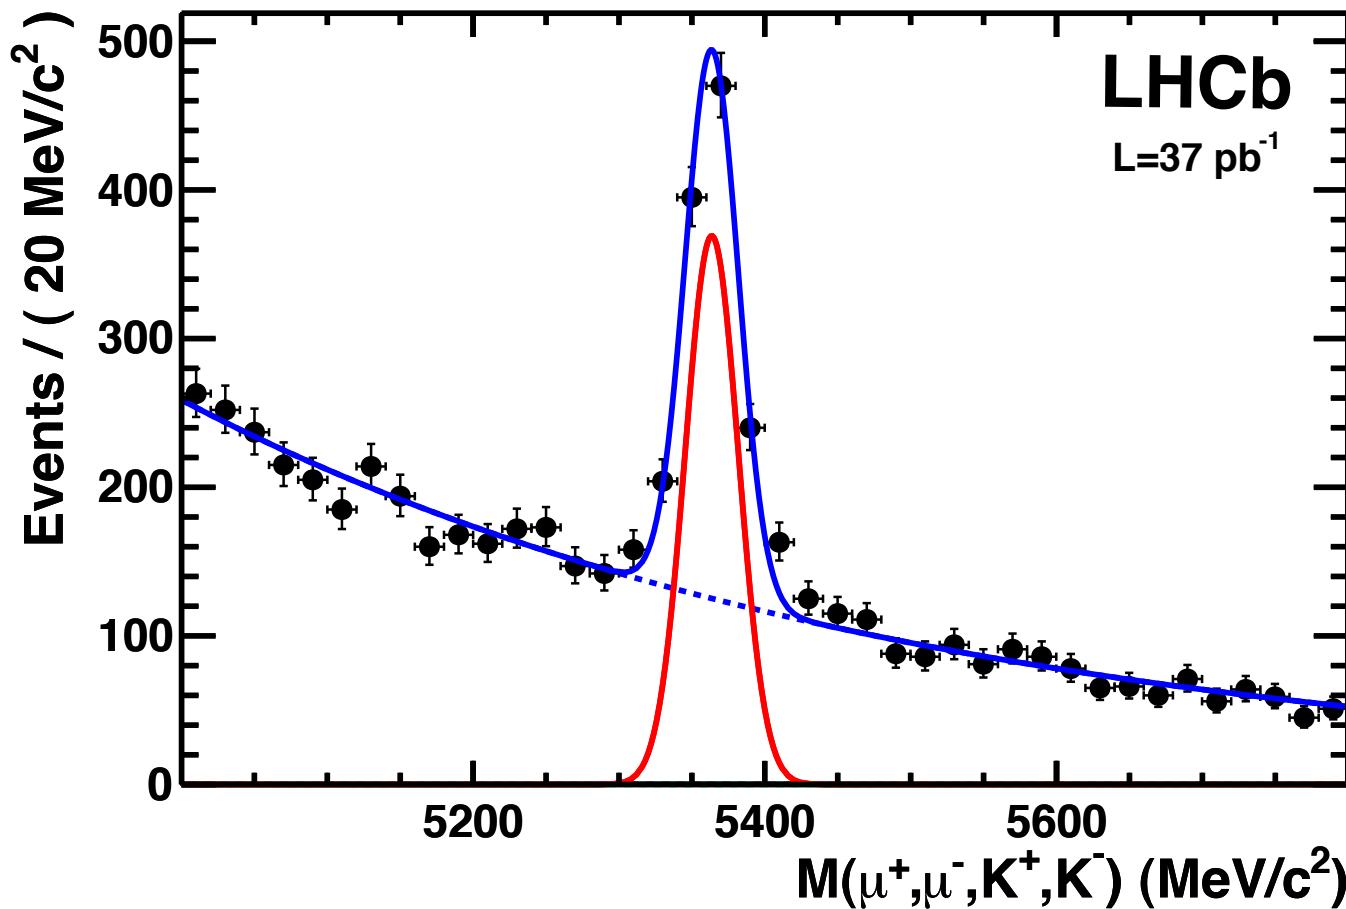

Invariant mass of the $B^+ \rightarrow J/\psi K^+$ candidates.

Yield: $12366 \pm 184(\text{stat})$ → enters in normalization factor

Fig7_Norm_Bu2JPsiK.png / png

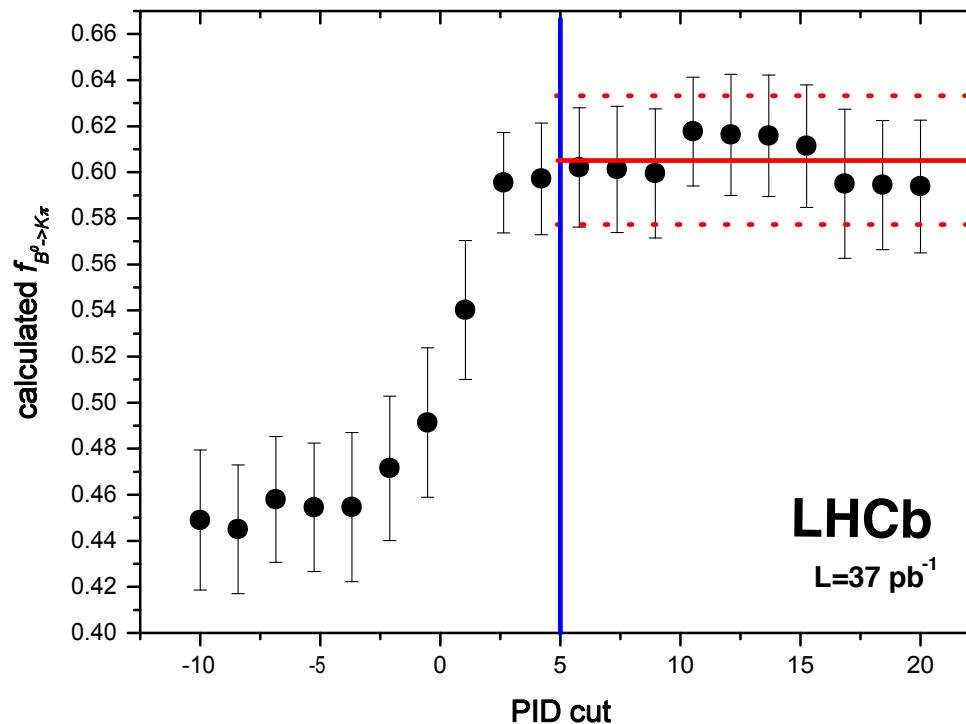

Normalization factor 2: JPsiPhi

Invariant mass of the $B_s \rightarrow J/\psi \phi$ candidates.
Yield: 822 ± 36 (stat) → enters in normalization factor

Fig8_Norm_Bs2JPsiPhi.png / png

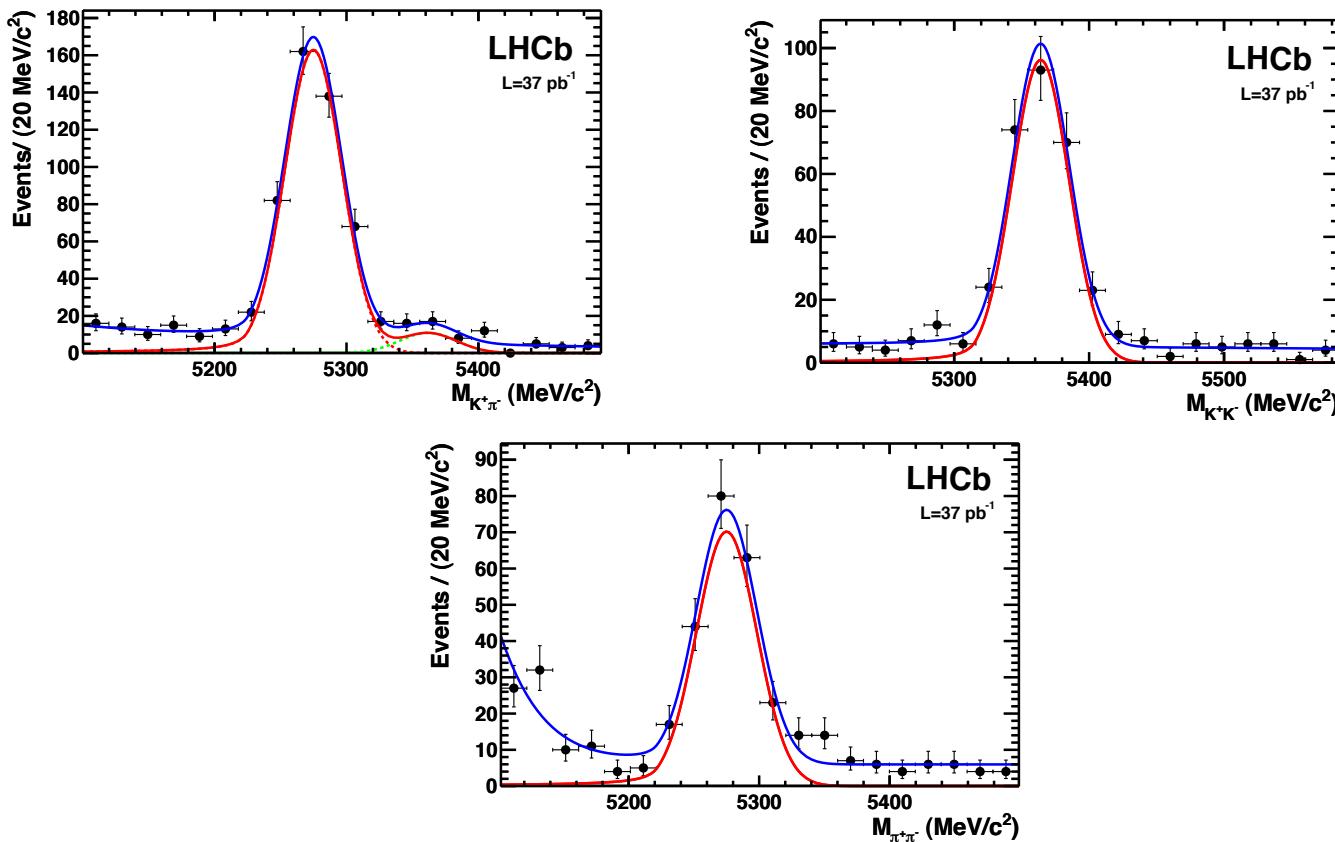

Normalization factor 3: fraction B2KPi

$f_{K\pi}$ (fraction of $B \rightarrow K\pi$ in the inclusive $B \rightarrow hh'$ sample) calculated using different PID cuts. The blue vertical line shows the start of the “plateau”. The red line shows the average value of $f_{K\pi}$ in the plateau and the dotted line the estimated uncertainty.

Fig9_f_BdKpi.png / png

Normalization factor 3: fraction B2KPi (2)

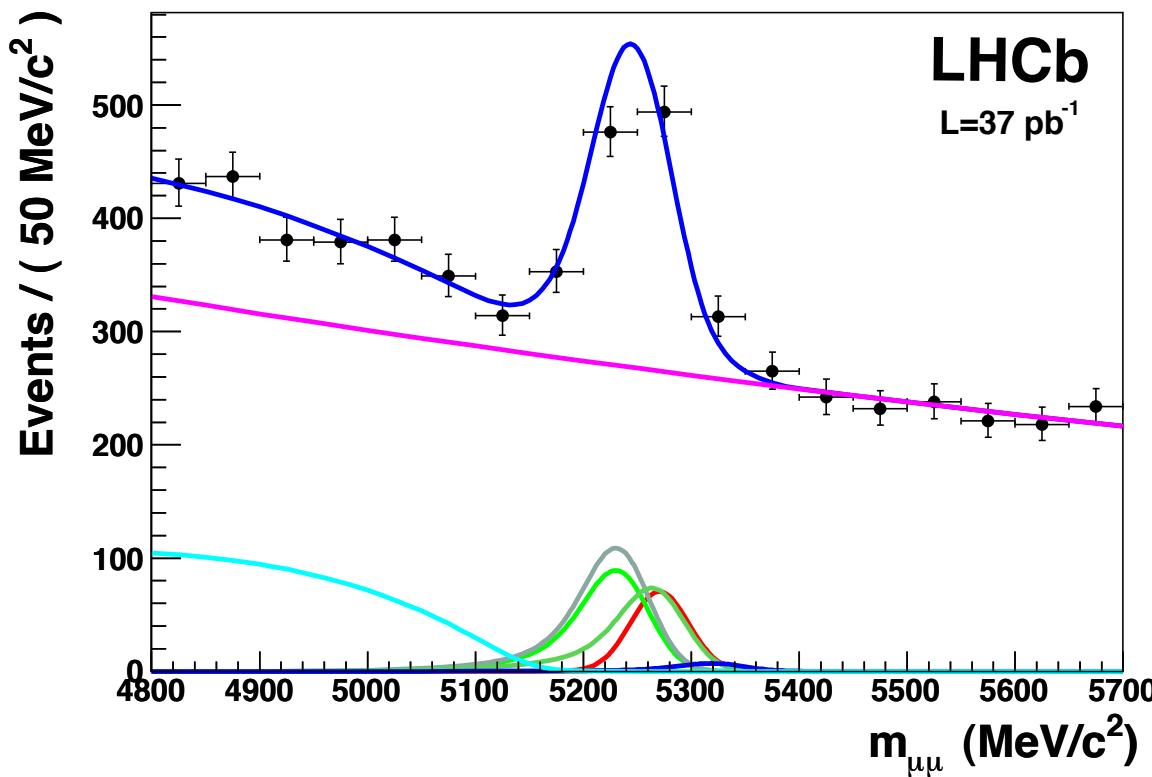

Invariant mass distributions for the different daughter mass hypotheses for $B \rightarrow hh'$. A $DLL(K-\pi) > 10$ is applied to identify the K and π candidates.

[Fig11_Exclusive_Bs2KK.png / png](#)

[Fig12_Exclusive_Bd2pipi.pdf / png](#)

Normalization factor 3: TIS B2hh

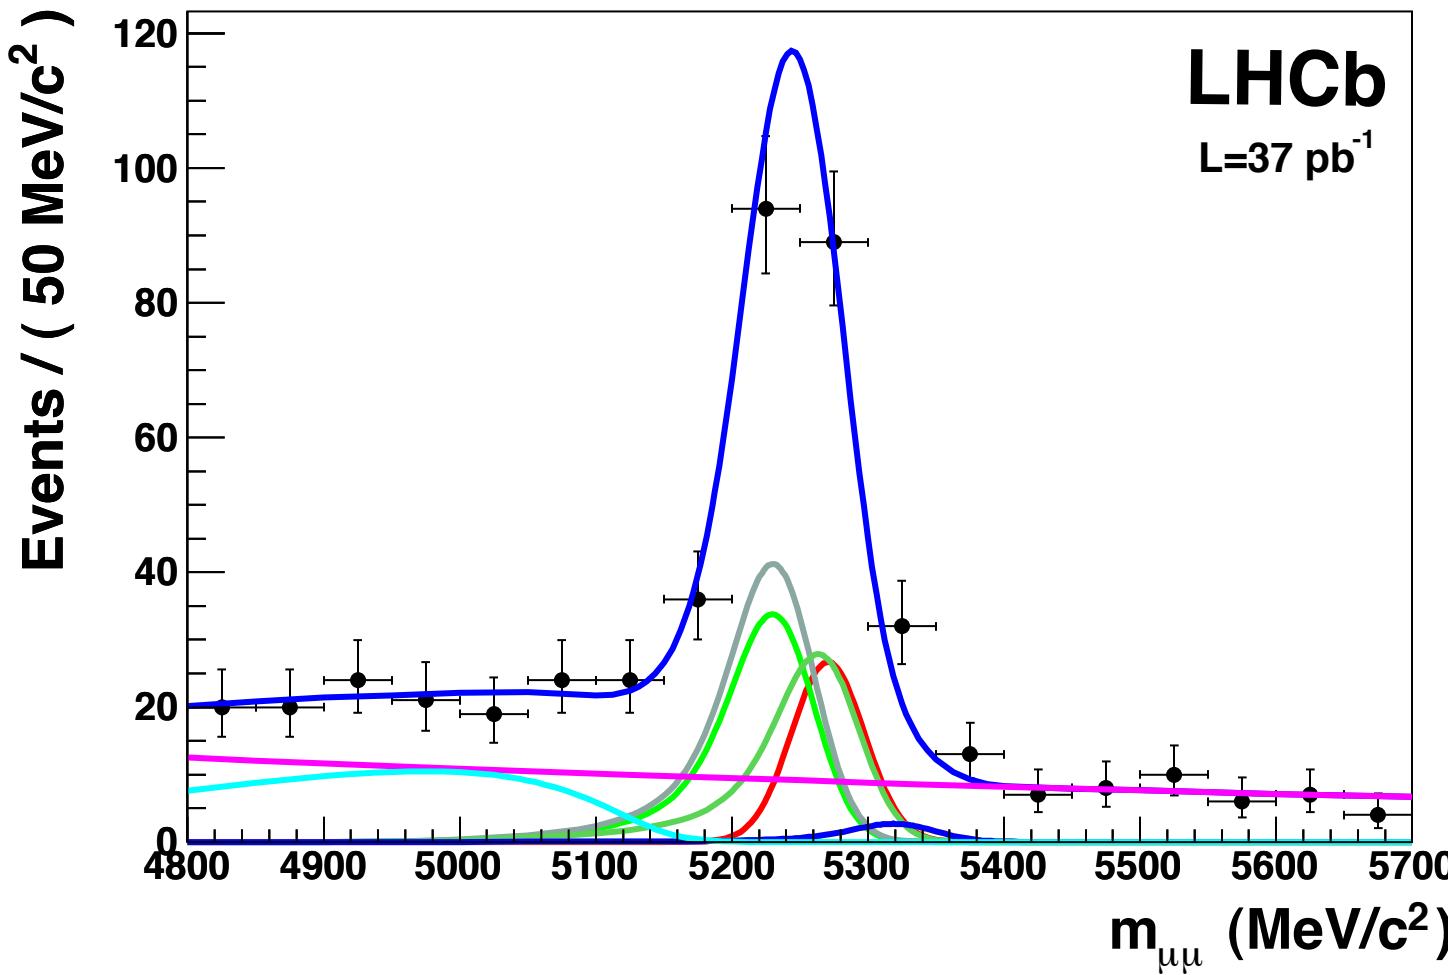

Invariant mass of the $B \rightarrow hh'$ candidates triggered independent of signal.

Yield: $611 \pm 56(\text{stat}) \rightarrow$ enters in normalization factor

Fig13_Norm_GLCalib_B2hh_TIS_allGL.png / png

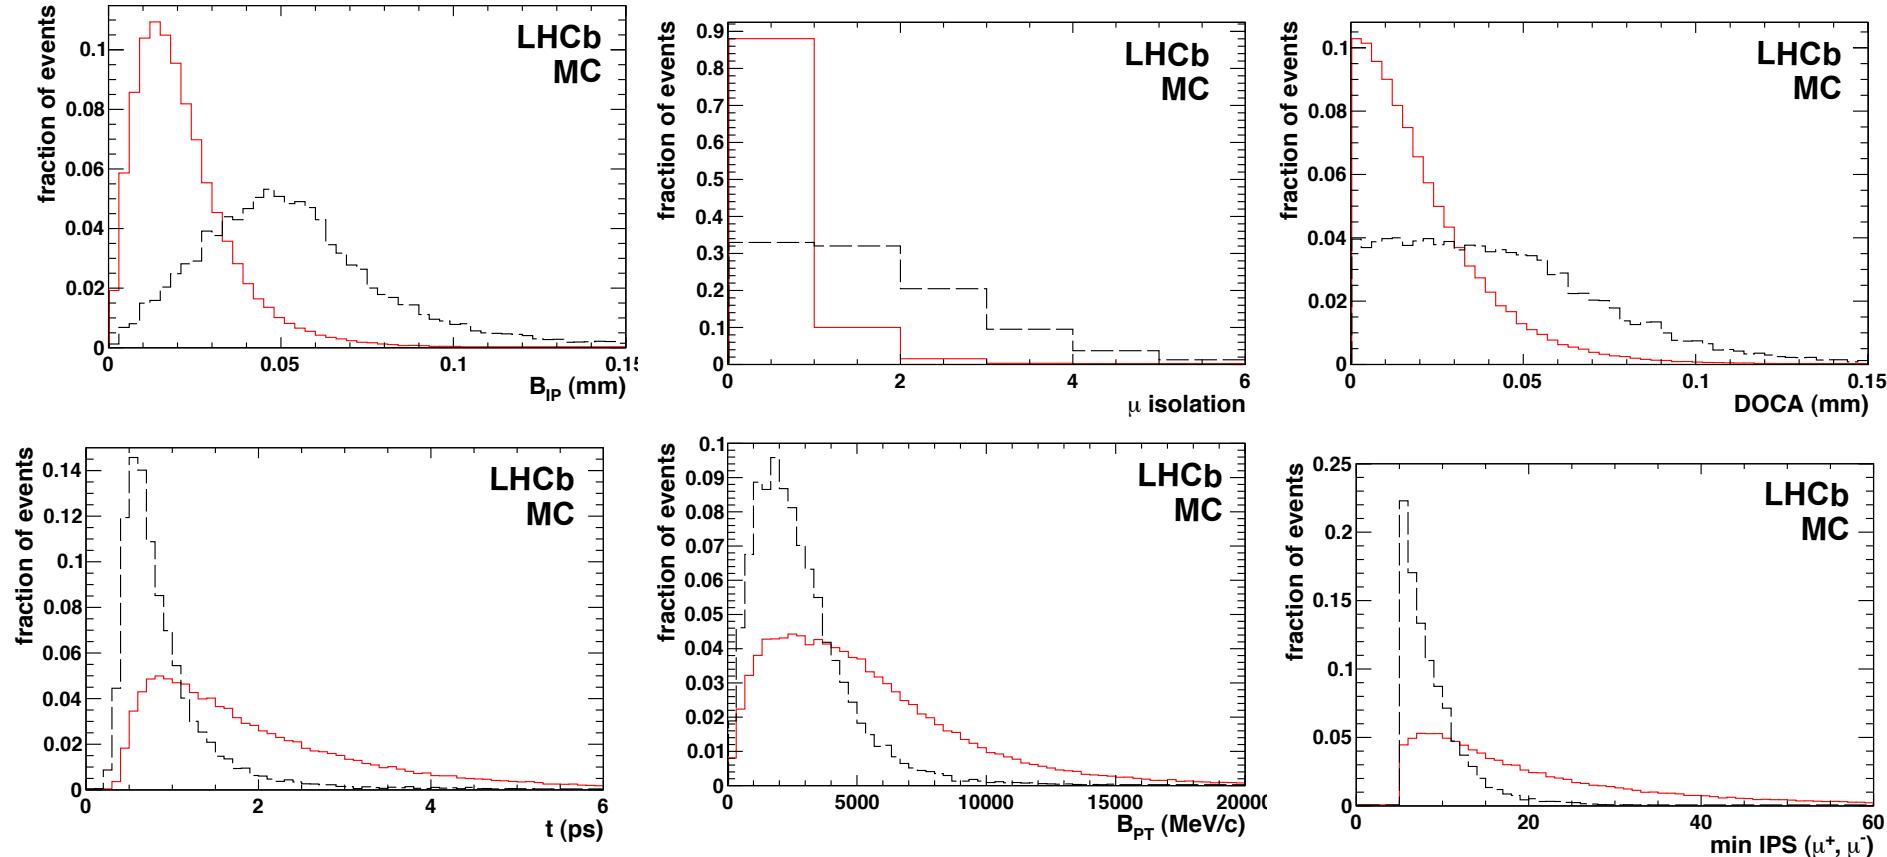

B2hh fit in GL bins: bin 4

Invariant mass of the $B \rightarrow hh'$ candidates triggered independent of signal. Shown is the GL range [0.75, 1].

Fig14_GLCalib_B2hh_TIS_GLabove075.pdf / png

GL training from MC

MC input distributions for GL definition. Shown is the signal
 $B_s \rightarrow \mu\mu$ and the background $b\bar{b} \rightarrow \mu\mu X$

MC: GL for signal and bkg

MC: GL distribution for signal (black) and $bb \rightarrow \mu\mu X$ background (green, filled).

Fig21_MC_GL_signalBkg.pdf / png

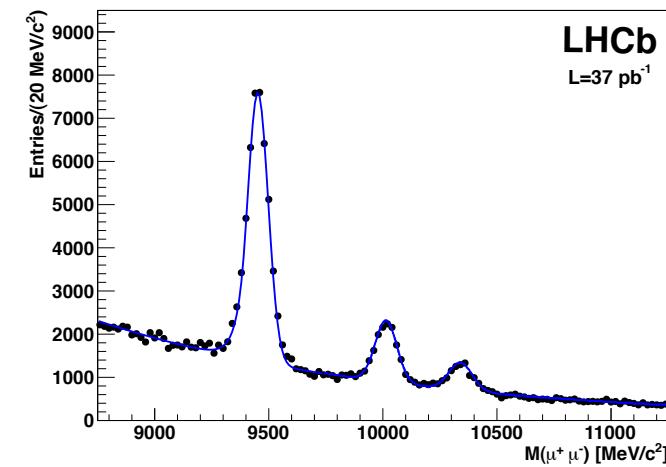

Mass resolution from J/psi, psi, Y

Invariant mass for J/ψ and ψ(2S)
candidates.

Fit chi2/ndf: 436/90

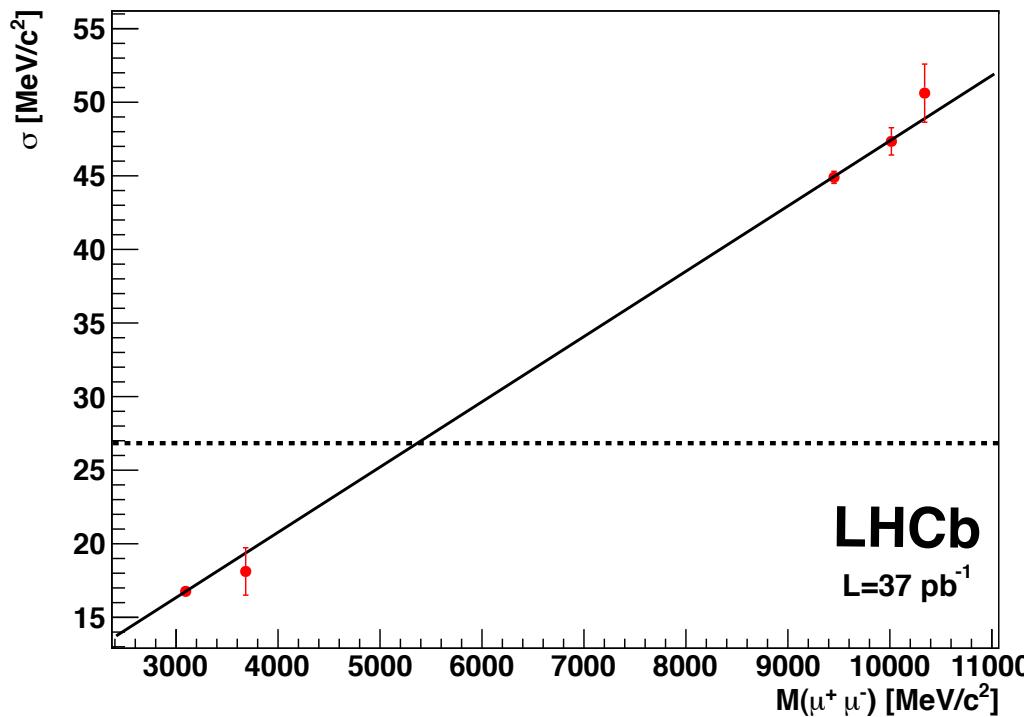

Fig22_Mass_JPsi.pdf / png

Invariant mass Y(1-3S) candidates.
Fit chi2/ndf: 298/112

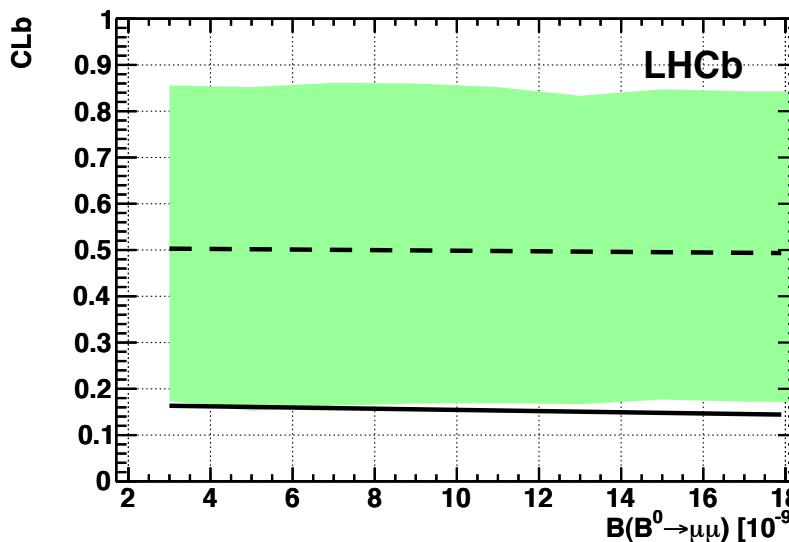

Fig23_Mass_Y.pdf / png

Mass resolution: linear interpolation

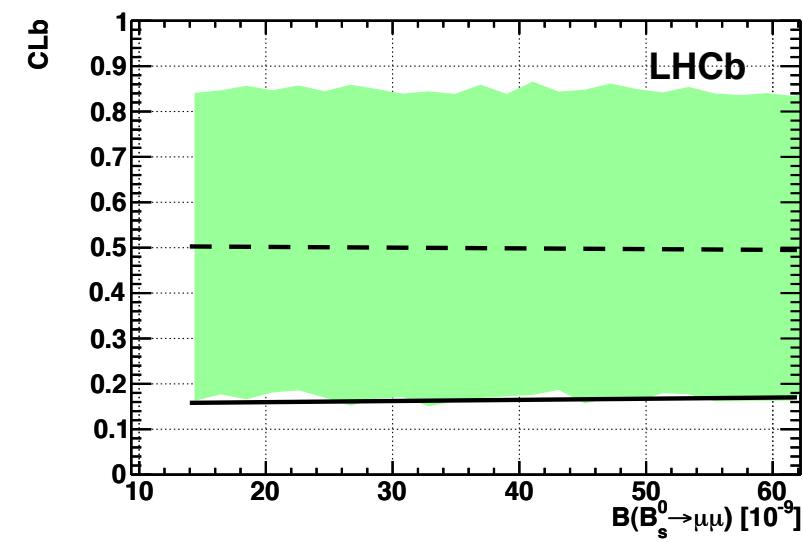

Linear interpolation of mass resolution between J/ψ , $\psi(2S)$ and $\Upsilon(1-3S)$ candidates. The vertical line indicates the resolution at the B_s mass.

Fig24_Mass_Interpolation.pdf / png

$B^0 \rightarrow \mu\mu$

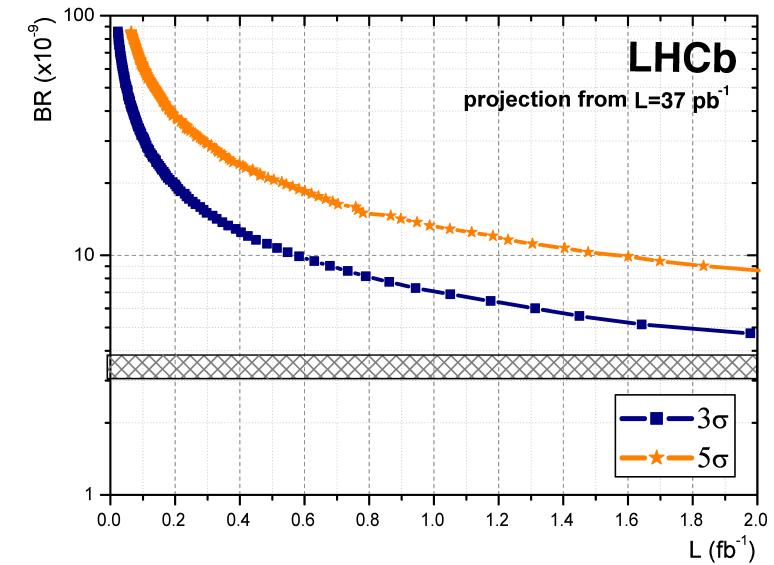

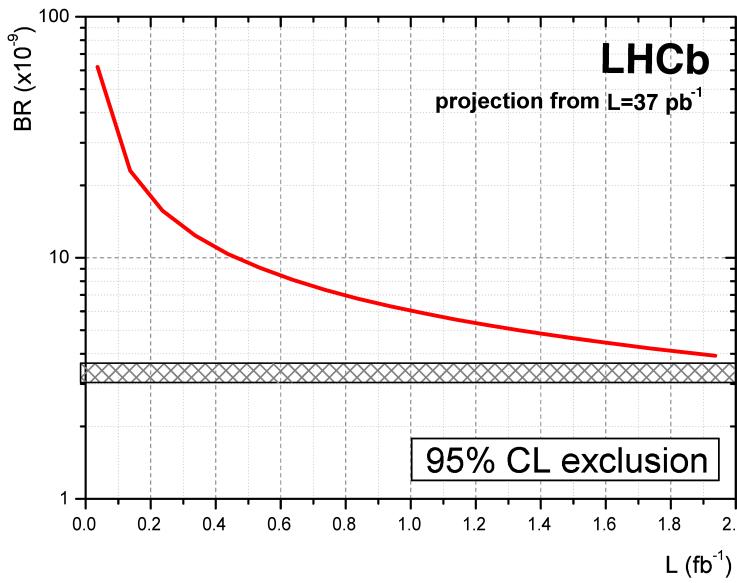

$B_s \rightarrow \mu\mu$

The dashed line is the background only expectation, the full line the observed data and the green area is the ±1 sigma area of compatible experiments.
